

Práctica 1:

Análisis de Eficiencia de

Algoritmos

Memoria

1. Cálculo de la eficiencia empirica.

Hemos llevado a cabo un estudio empirico del comportamiento de los algoritmos analizados. Para ello mediremos los recursos empleados para cada tamaño de entradas.

En los algoritmos de ordenación el tamaño de las entradas viene dado por el numero de elementos de dicho vector a ordenar.

En otro ejemplos como el de la torre de Hanoi dependerá del numero de discos con los que se desee jugar, en el algoritmo de Floyd, depende de los nodos que tenga el grafo que se utiliza en cada caso.

Con el resultado de la eficiencia empirica, al proba con diferentes tamaños, realizaremos las graficas.

1.1 Algoritmos de ordenación

- Burbuja:

| n° elementos | Tiempo(s) | n° elementos | Tiempo(s) | n° elementos | Tiempo(s) | n° elementos | Tiempo(s) |

2. Calculo de eficiencia hibrida.

La eficiencia hibrida se simplifica a buscar de cada uno de los algoritmos que tenemos que calcular sus constantes ocultas. Para conocerlos ajustamos la función a un conjunto de puntos. Para este ajuste emplearemos regresión por minimos cuadrados.

Cuando ya tengamos todas estas eficiencias serán dibujadas con gnuplot.

2.1 Algoritmos de ordenación.

- Burbuja:

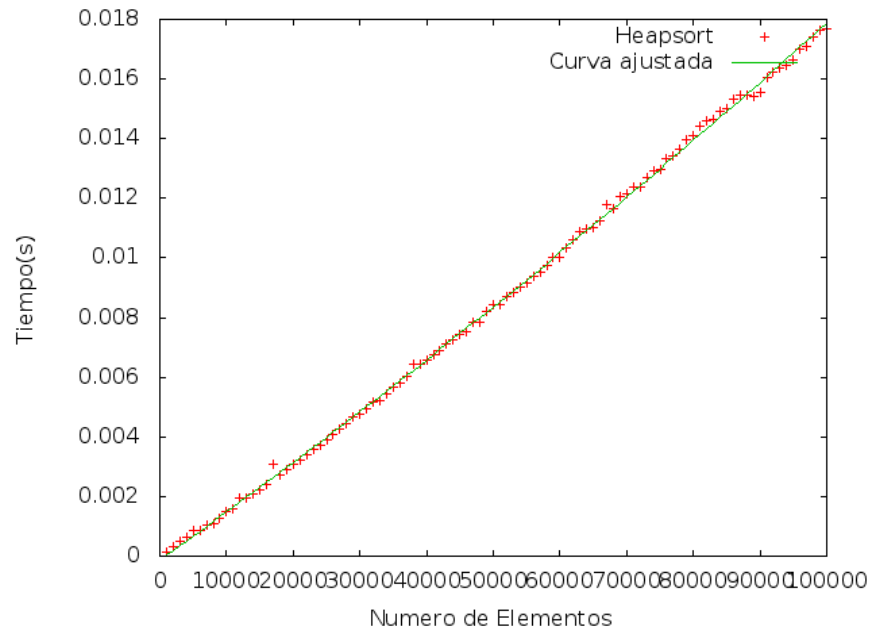

- Selección:

- Insercción:

- Heapsort:

- Mergesort:

- Floyd:

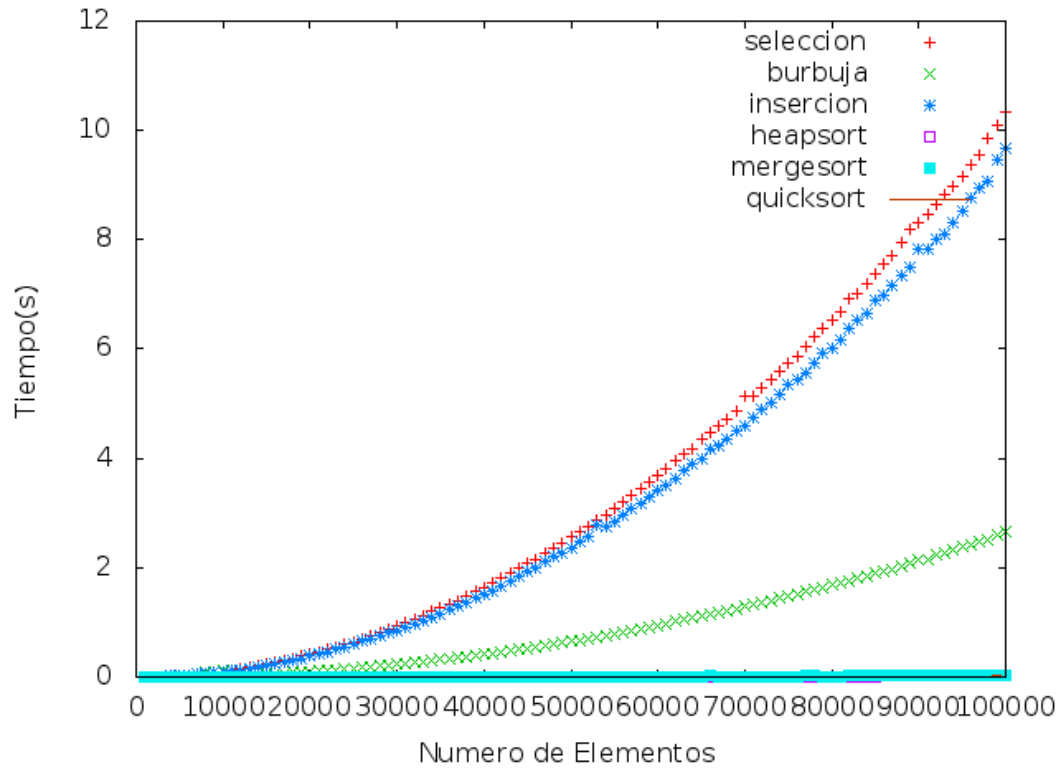

3. Comparación de algoritmos.

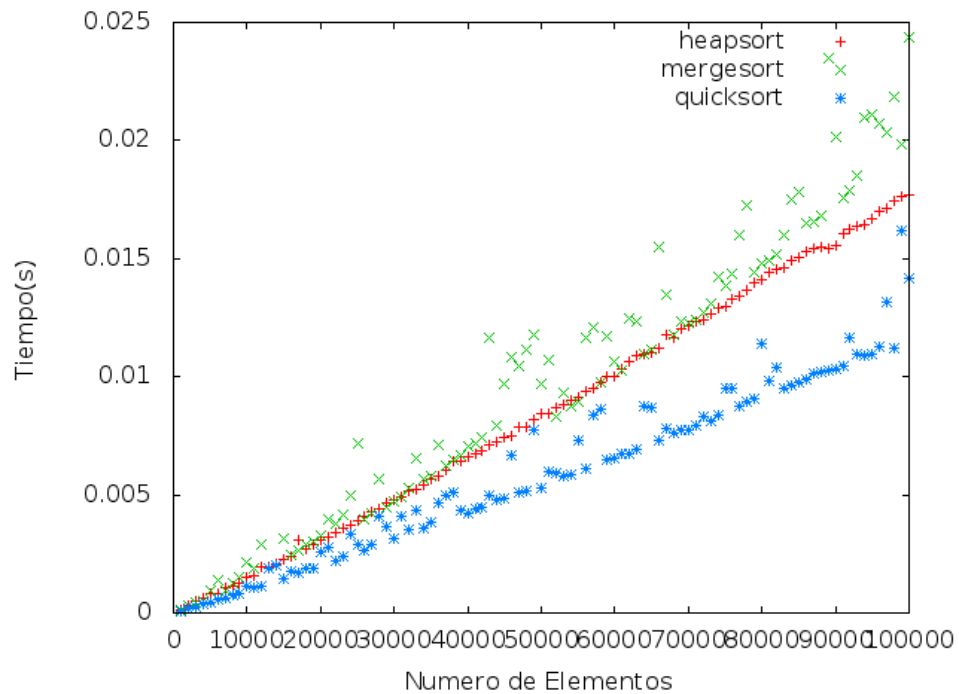

3.1 Comparación de Burbuja en diferentes ordenadores con mismo Sistema Operativo.

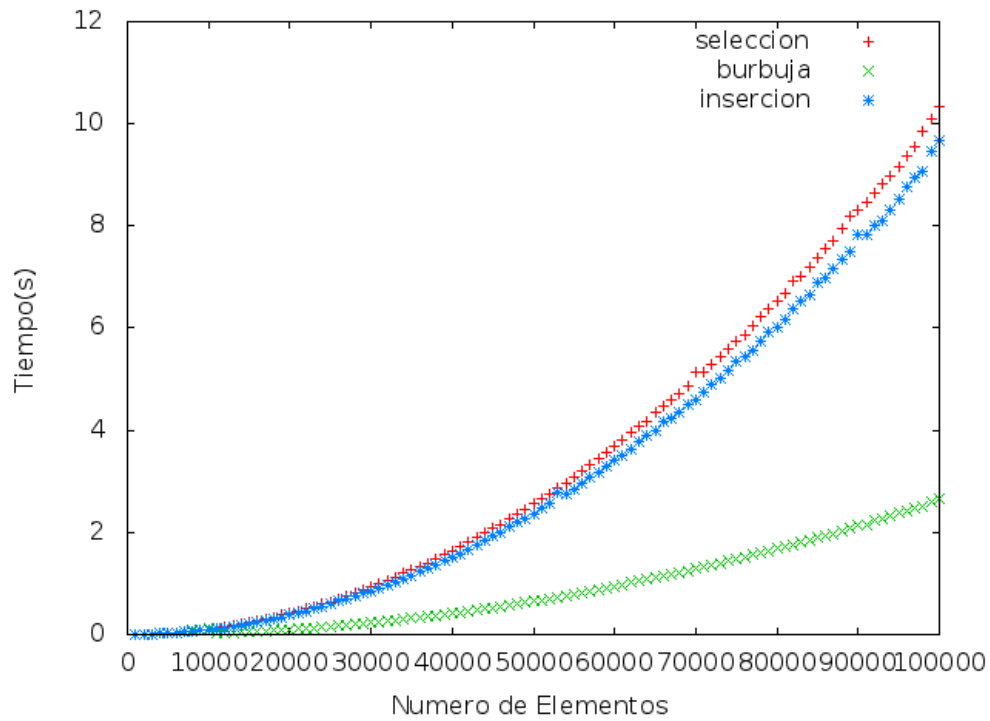

3.2 Todos los algoritmos.

3.3 Comparacion de los Sort

3.4 Comparacion de los $O(n^2)$

3.5 Comparacion distinta Optimizacion

3.6 Conclusiones.

Las opiniones que hemos sacado es que de los algoritmos de ordenacion $O(n^2)$ y el algoritmo de floyd con pocos elementos son mas eficientes pero al elevar el numero de elementos se disparan, eso tambien ocurre con el algoritmo de las torres de hanoi aunque mas brusco. Los algoritmos de orden $n \log(n)$ pues resultan mas eficientes para los vectores con mayor tamaño , como se ven en los graficos.

La rapidez de dichos algoritmos tambien depende del ordenador en el que se ejecuta como antes se ha mostrado en un grafico, no solo el ordenador si no la optimizacion que se le ponga y sistema operativo que se lo ejecute.
